$$\begin{array}{c} \text{Nonlinear} \\ \text{activity dynamics} \end{array} + \begin{array}{c} \text{Complex} \\ \text{network} \end{array} + \begin{array}{c} \text{Nonlinear} \\ \text{adaptation (plasticity)} \end{array}$$

$$\frac{dx_i}{dt} = F(x_i) + G(x_i, \sum_{j=1}^N W_{ij} x_j)$$

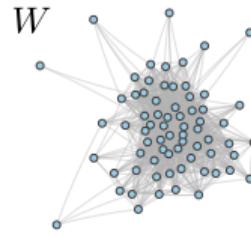

**Complete
dynamics**
 $N \gg 1$

$$\begin{aligned}\frac{dx_i}{dt} &= F(x_i) + G(x_i, \sum_{j=1}^N W_{ij} x_j) \\ \frac{dW_{ij}}{dt} &= H(x_i, x_j, W_{ij}) \\ i, j &\in \{1, \dots, N\}\end{aligned}$$

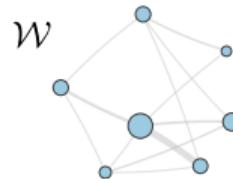

**Complete
dynamics**
 $N \gg 1$

$$\begin{aligned}\frac{dx_i}{dt} &= F(x_i) + G(x_i, \sum_{j=1}^N W_{ij} x_j) \\ \frac{dW_{ij}}{dt} &= H(x_i, x_j, W_{ij}) \\ i, j &\in \{1, \dots, N\}\end{aligned}$$

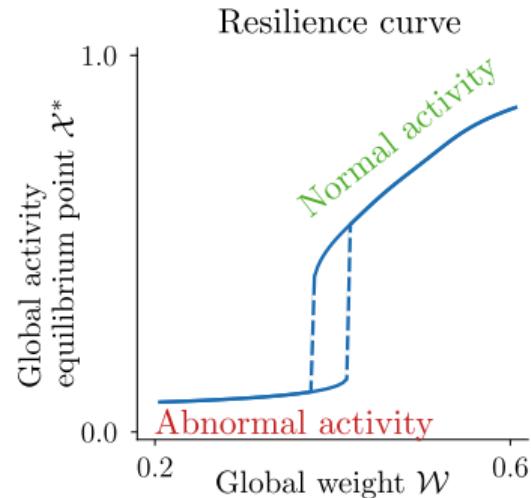

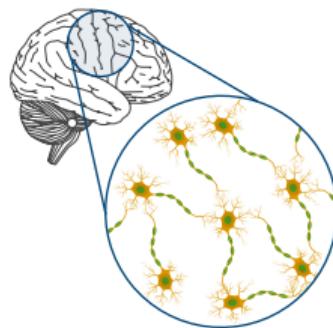

**Reduced
dynamics**
 $n \ll N$

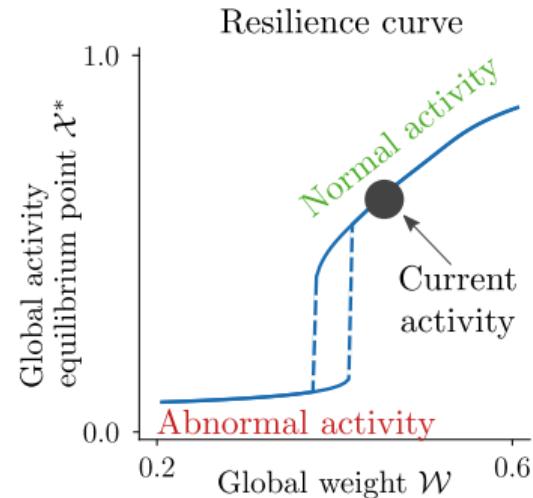

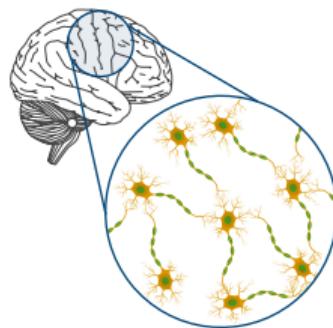

$$\begin{aligned}\frac{d\mathcal{X}_\mu}{dt} &= f(\mathcal{X}_1, \dots, \mathcal{X}_n, \mathcal{W}) \\ \frac{d\mathcal{W}_{\mu\nu}}{dt} &= h(\mathcal{X}_\mu, \mathcal{X}_\nu, \mathcal{W}) \\ \mu, \nu &\in \{1, \dots, n\}\end{aligned}$$

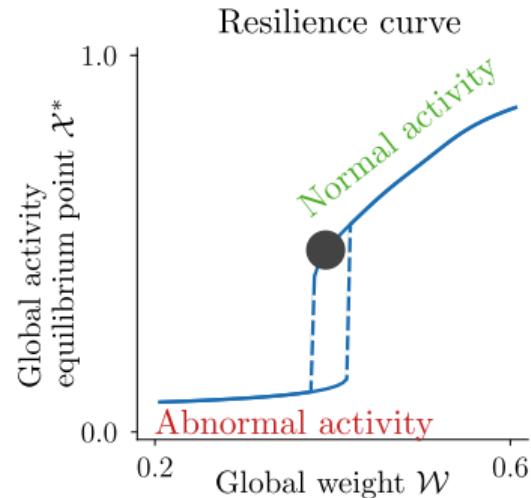

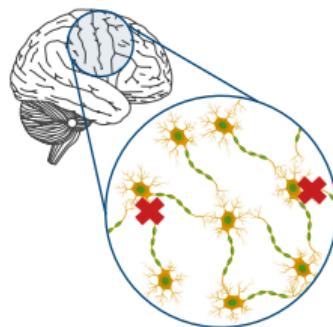

Why dimension reduction?

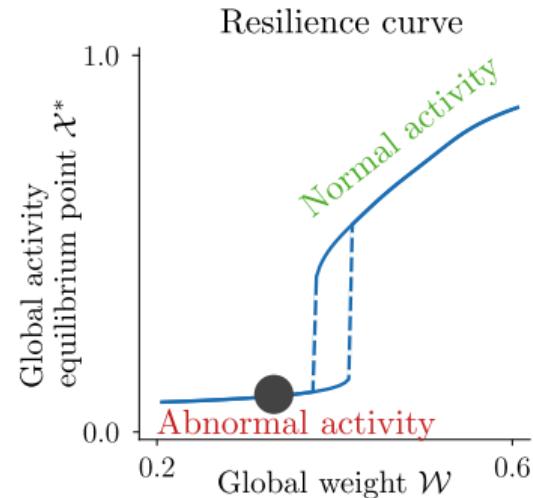

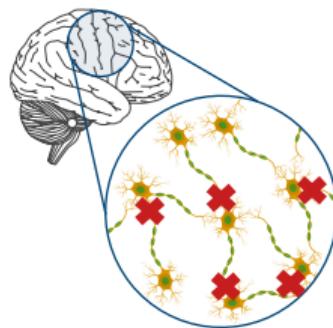

Why dimension reduction?

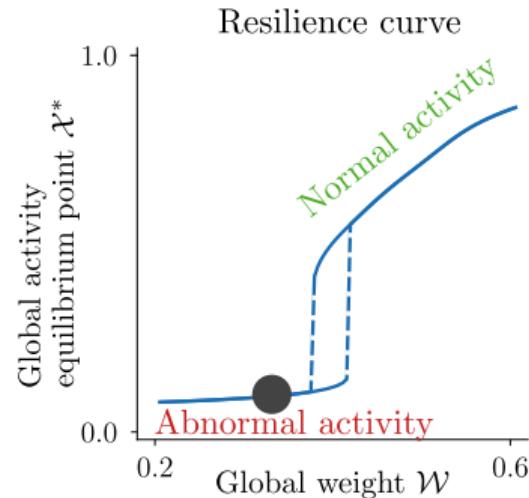

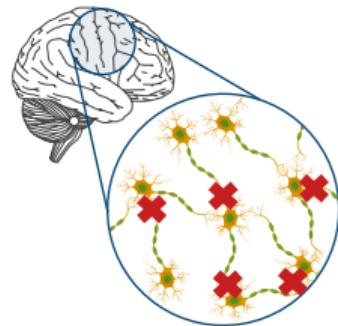

Why dimension reduction?

Why dimension reduction?

Why dimension reduction?

Dimension reduction allows to ...

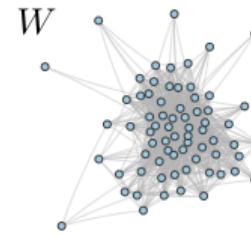

- find meaningful global variables $\mathcal{X}_\mu, \mathcal{W}_{\mu\nu}$;
- get analytical insights on resilience;
- reduce computational cost.

Contribution

Complete
dynamics

$$N \gg 1$$

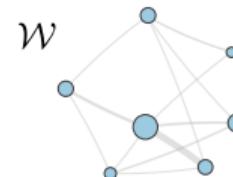

$$\begin{aligned}\frac{dx_i}{dt} &= F(x_i) + G(x_i, \sum_{j=1}^N W_{ij}x_j) \\ \frac{dW_{ij}}{dt} &= H(x_i, x_j, W_{ij}) \\ i, j &\in \{1, \dots, N\}\end{aligned}$$

Reduced
dynamics

$$n \ll N$$

$$\begin{aligned}\frac{d\mathcal{X}_\mu}{dt} &= f(\mathcal{X}_1, \dots, \mathcal{X}_n, \mathcal{W}) \\ \frac{d\mathcal{W}_{\mu\nu}}{dt} &= h(\mathcal{X}_\mu, \mathcal{X}_\nu, \mathcal{W}) \\ \mu, \nu &\in \{1, \dots, n\}\end{aligned}$$

Contribution

Complete
dynamics
 $N \gg 1$

$$\begin{aligned}\frac{dx_i}{dt} &= F(x_i) + G(x_i, \sum_{j=1}^N W_{ij}x_j) \\ \frac{dW_{ij}}{dt} &= H(x_i, x_j, W_{ij}) \\ i, j &\in \{1, \dots, N\}\end{aligned}$$

Reduced
dynamics
 $n \ll N$

$$\begin{aligned}\frac{d\mathcal{X}_\mu}{dt} &= f(\mathcal{X}_1, \dots, \mathcal{X}_n, \mathcal{W}) \\ \frac{d\mathcal{W}_{\mu\nu}}{dt} &= h(\mathcal{X}_\mu, \mathcal{X}_\nu, \mathcal{W}) \\ \mu, \nu &\in \{1, \dots, n\}\end{aligned}$$

We found $n + n^2$ linear observables (functions, measures,...)

$$\mathcal{X}_\mu = \sum_{i=1}^N M_{\mu i} x_i,$$

$$\mathcal{W}_{\mu\nu} = \sum_{i,j=1}^N M_{\mu i} W_{ij} M_{j\nu}^\top,$$

We found $n + n^2$ linear observables (functions, measures,...)

$$\mathcal{X}_\mu = \sum_{i=1}^N M_{\mu i} x_i,$$

$$\mathcal{W}_{\mu\nu} = \sum_{i,j=1}^N M_{\mu i} W_{ij} M_{j\nu}^\top,$$

that both depend on only *one* matrix.

M is a $n \times N$ matrix to be determined.

Hypothesis

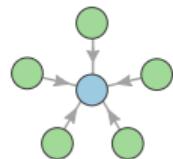

Important neurons contribute strongly to the global activity

Hypothesis

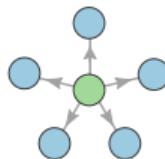

Important neurons contribute strongly to the global activity

Example:

- Important paper
- Important review

Authority centrality

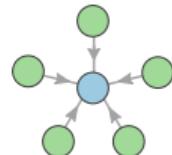

Hub centrality

Hypothesis

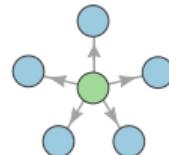

Important neurons contribute strongly to the global activity

Example:

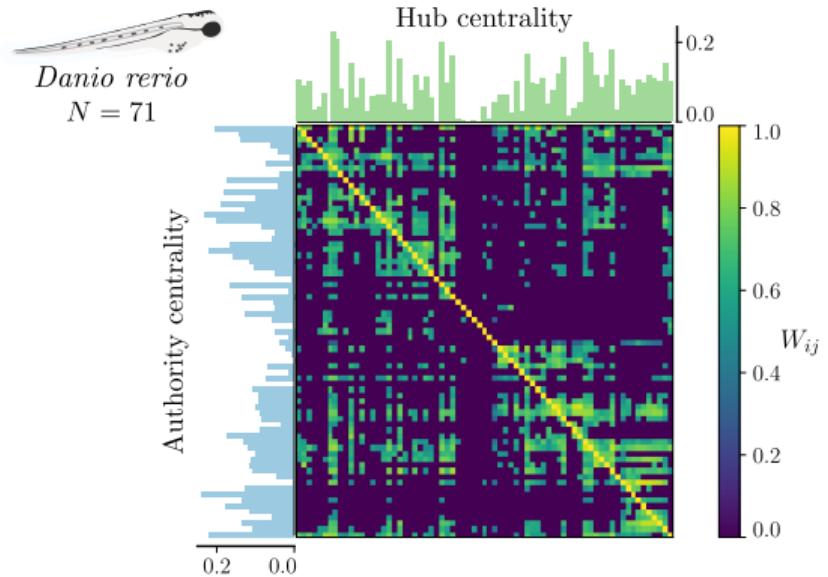

- Important paper

Authority centrality

Hub centrality

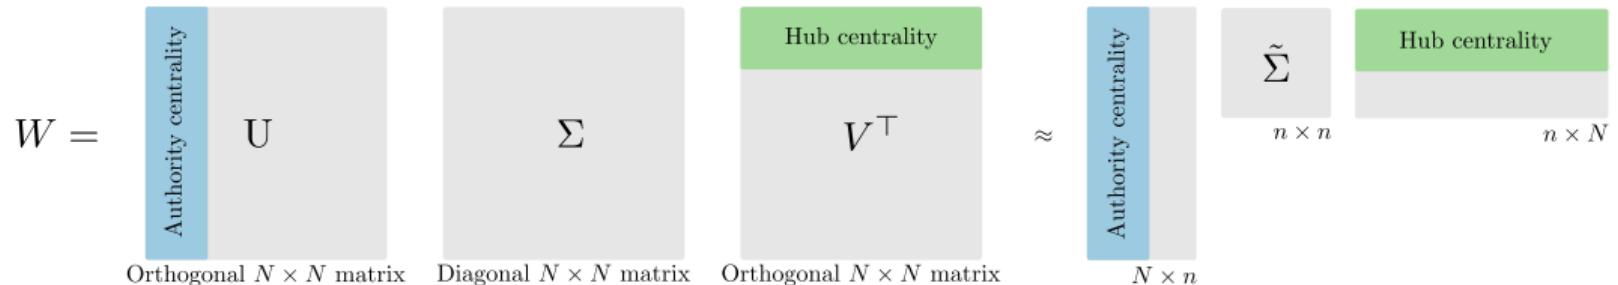

Singular value decomposition (SVD)

Singular value decomposition (SVD)

$$W = \begin{matrix} \text{Authority centrality} \\ U \\ \text{Orthogonal } N \times N \text{ matrix} \end{matrix} \quad \Sigma \quad \begin{matrix} \text{Hub centrality} \\ V^\top \\ \text{Orthogonal } N \times N \text{ matrix} \end{matrix} \quad \approx \quad \begin{matrix} \text{Authority centrality} \\ \Sigma \\ n \times n \end{matrix} \quad \begin{matrix} \text{Hub centrality} \\ n \times N \end{matrix}$$

Singular value decomposition (SVD)

Let $r = \text{rank}(W)$.

If $n \geq r$, the factorization is exact.

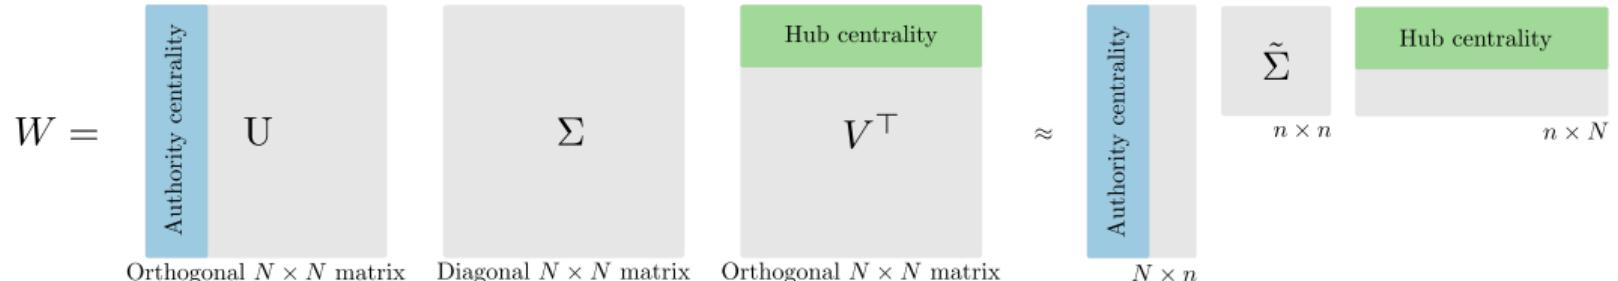

If $n < r$, it is the best* approximation of W .

Singular value decomposition (SVD)

$$W = \begin{array}{c} \text{Authority centrality} \\ \hline \text{U} \end{array} \quad \begin{array}{c} \Sigma \\ \hline \text{Diagonal } N \times N \text{ matrix} \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline V^\top \\ \hline \text{Orthogonal } N \times N \text{ matrix} \end{array} \quad \approx \quad \begin{array}{c} \text{Authority centrality} \\ \hline \tilde{\Sigma} \\ \hline n \times n \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline \text{Hub centrality} \\ \hline n \times N \end{array}$$

$$M = \begin{array}{c} \tilde{\Sigma}^{1/2} \\ \hline n \times n \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline n \times N \end{array} \quad \mu = 1$$

Singular value decomposition (SVD)

The diagram shows the decomposition of a matrix M . On the left, M is shown as $\tilde{\Sigma}^{1/2}$ (an $n \times n$ matrix) multiplied by a matrix W (a $n \times N$ matrix). The matrix W has a vertical bar labeled "Hub centrality" and is labeled $\mu = 1$. An arrow points from this to the right side of the equation. On the right, the expression $\mathcal{X}_\mu = \sum_{i=1}^N M_{\mu i} x_i$ is given. Below it, the expression $\mathcal{W}_{\mu\nu} = \sum_{i,j=1}^N M_{\mu i} W_{ij} M_{j\nu}^\top$ is given, followed by the text "Meaningful at least for $\mu, \nu = 1$!".

$M =$

$\tilde{\Sigma}^{1/2}$

$n \times n$

W

$n \times N$

$\mu = 1$

\Rightarrow

$\mathcal{X}_\mu = \sum_{i=1}^N M_{\mu i} x_i$

$\mathcal{W}_{\mu\nu} = \sum_{i,j=1}^N M_{\mu i} W_{ij} M_{j\nu}^\top$

Meaningful at least for $\mu, \nu = 1$!

Singular value decomposition (SVD)

$$W = \begin{array}{c} \text{Authority centrality} \\ \hline \text{U} \end{array} \quad \begin{array}{c} \Sigma \\ \hline \text{Diagonal } N \times N \text{ matrix} \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline V^\top \\ \hline \text{Orthogonal } N \times N \text{ matrix} \end{array} \quad \approx \quad \begin{array}{c} \text{Authority centrality} \\ \hline \tilde{\Sigma} \\ \hline n \times n \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline \text{Hub centrality} \\ \hline n \times N \end{array}$$

$$M = \begin{array}{c} \tilde{\Sigma}^{1/2} \\ \hline n \times n \end{array} \quad \begin{array}{c} \text{Hub centrality} \\ \hline n \times N \end{array} \quad \mu = 1 \quad \Rightarrow \quad \begin{array}{l} \mathcal{X}_\mu = \sum_{i=1}^N M_{\mu i} x_i \\ \mathcal{W}_{\mu\nu} = \sum_{i,j=1}^N M_{\mu i} W_{ij} M_{j\nu}^\top \end{array} \quad \Rightarrow \quad \begin{array}{c} \text{Reduced} \\ \text{dynamics} \end{array}$$

Meaningful at least for $\mu, \nu = 1$!

We can combine the observables to get the global activities and weights :

$$\mathcal{X} = a_1 \mathcal{X}_1 + \dots + a_n \mathcal{X}_n$$

$$\mathcal{W} = b_{11} \mathcal{W}_{11} + b_{12} \mathcal{W}_{12} + \dots + b_{nn} \mathcal{W}_{nn}$$

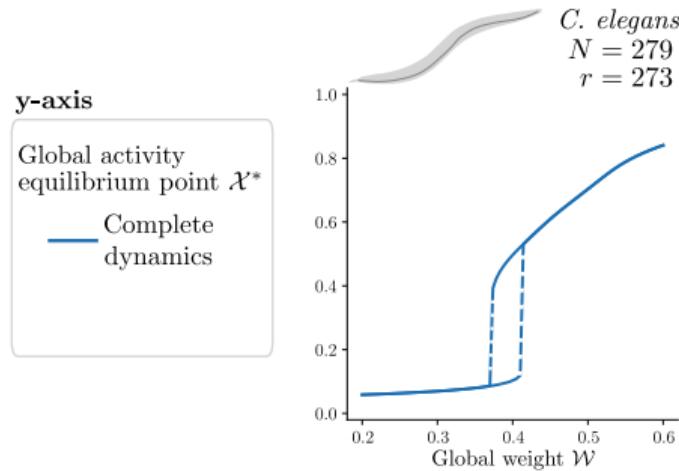

We can combine the observables to get the global activities and weights :

$$\mathcal{X} = a_1 \mathcal{X}_1 + \dots + a_n \mathcal{X}_n$$

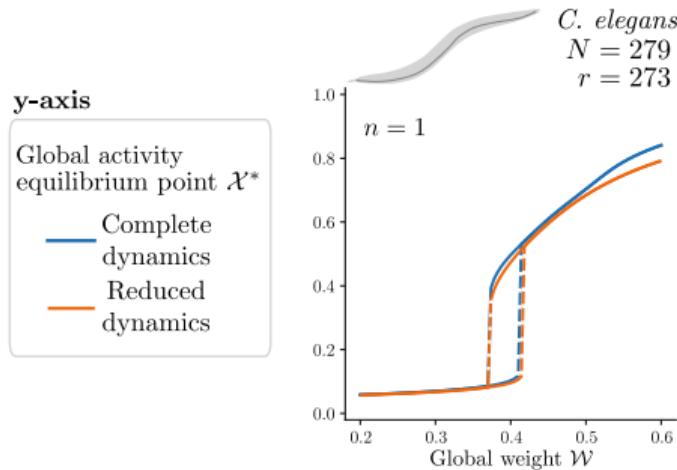

$$\mathcal{W} = b_{11} \mathcal{W}_{11} + b_{12} \mathcal{W}_{12} + \dots + b_{nn} \mathcal{W}_{nn}$$

We are ready to get bifurcation diagrams \mathcal{X} vs. \mathcal{W} .

Next steps

- Treat plasticity + real networks;
- Consider inhibitors ($W_{ij} < 0$);
- Get more profound insights on resilience.

Take home messages

- Plasticity leads to *rich* bifurcation diagrams;
- SVD is a powerful and *interpretable* tool for dimension reduction of *dynamics*.

In this model, F is linear and G is a sigmoid function :

$$\tau_x \dot{x}_i = -x_i + 1/(1 + e^{-a(y_i - b)}), \quad \text{with} \quad y_i = \sum_{j=1}^N W_{ij} x_j$$

- x_i : Firing rate of neuron or brain region i
- τ_x : Time scale of the firing rate
- a : Steepness of the activation function
- b : Firing rate threshold

This model is more complex :

$$\begin{aligned}\tau_x \dot{x}_i &= -\alpha_i x_i + \beta_i / (1 + e^{-a(y_i - b)}), \quad \text{with} \quad y_i = \sum_{j=1}^N W_{ij} x_j + \gamma_i \\ \tau_w \dot{W}_{ij} &= D_{ij} x_i x_j (x_i - \theta_i) - \varepsilon W_{ij} \quad \text{with} \quad W_{ij}(0) = d_{ij} D_{ij} \\ \tau_\theta \dot{\theta}_i &= x_i^2 - \theta_i.\end{aligned}$$

θ_i : modify the threshold above (below) which the synapse potentiates (depresses).

$\alpha_i, \beta_i, \gamma_i$: distinguish the dynamical behavior of each node i .

$D = (D_{ij})_{i,j=1}^N$: structural backbone, $D_{ij} > 0$ if the presynaptic neuron j excites the postsynaptic neuron i , $D_{ij} < 0$ if the presynaptic neuron j inhibits the postsynaptic neuron i , and $D_{ij} = 0$ if no edge exist between neurons i and j .
